ROUND ROBIN SCHEDULING

Aim:

To implement the Round Robin (RR) scheduling technique

Algorithm:

- 1. Declare the structure and its elements.
- 2. Get number of processes and Time quantum as input from the user.
- 3. Read the process name, arrival time and burst time
- 4. Create an array **rem_bt[]** to keep track of remaining burst time of processes which is initially copy of bt[] (burst times array)
- 5. Create another array **wt[]** to store waiting times of processes. Initialize this array as 0. 6. Initialize time: t = 0
- 7. Keep traversing the all processes while all processes are not done. Do following for i'th process if it is not done yet.

```
a- If rem_bt[i] > quantum
```

- (i) t = t + quantum
- (ii) bt_rem[i] -= quantum;

b- Else // Last cycle for this process

- (i) $t = t + bt_rem[i]$;
- (ii) wt[i] = t bt[i]
- (iii) bt_rem[i] = 0; // This process is over
- 8. Calculate the waiting time and turnaround time for each process.
- 9. Calculate the average waiting time and average turnaround time.
- 10. Display the results.

Program Code:

```
#include <stdio.h>
int main() {
int n, quantum, i, t = 0, x, done;
printf("Enter number of processes and time quantum: ");
scanf("%d %d", &n, &quantum);
```

```
int at[n], bt[n], rem_bt[n], wt[n], tat[n];
x = n;
printf("Enter arrival time and burst time for each process:\n");
for (i = 0; i < n; i++) {
  scanf("%d %d", &at[i], &bt[i]);
  rem_bt[i] = bt[i];
  wt[i] = 0;
  }
printf("\nProcess\tAT\tBT\tWT\tTAT\n");
int total_wt = 0, total_tat = 0;
  for (t = 0, i = 0; x != 0;) {
  if (rem_bt[i] > 0 \&\& at[i] \le t) {
    if (rem_bt[i] > quantum) {
      t += quantum;
      rem_bt[i] -= quantum;
    } else {
      t += rem_bt[i];
      wt[i] = t - at[i] - bt[i];
      tat[i] = t - at[i];
      total_wt += wt[i];
      total_tat += tat[i];
      rem_bt[i] = 0;
      X--;
      }
  }
  i = (i + 1) \% n;
  printf("\nAverage WT: %.2f\nAverage TAT: %.2f\n", (float)total_wt / n, (float)total_tat / n);
  return 0;
}
```

OUTPUT:

```
Enter number of processes and time quantum: 4 3
Enter arrival time and burst time for each process:
0 4
1 7
2 5
3 6
Process AT
                вт
                       WT
                               TAT
P1
        0
                4
                        9
                               13
              5
P3
       2
                               16
                       11
P4
       3
                6
                       12
                               18
P2
       1
                7
                               21
                        14
Average WT: 11.50
Average TAT: 17.00
```

RESULT:

Hence, RoundRobin CPU Scheduling has been executed successfully.
